Automated Structural Testing with PathCrawler

A Tutorial

Nicky.WILLIAMS@cea.fr, Nikolai.KOSMATOV@cea.fr,
CEA, LIST, Software Safety Lab
Saclay (Paris), France

2012
Outline

1. Structural testing: a brief introduction
2. PathCrawler tool
3. Test parameters
4. Oracle and program debugging
5. Structural test for other properties/purposes
6. Strengths and limits of structural testing
7. Bypassing the limits
Outline

1. Structural testing: a brief introduction
2. PathCrawler tool
3. Test parameters
4. Oracle and program debugging
5. Structural test for other properties/purposes
6. Strengths and limits of structural testing
7. Bypassing the limits
**Structural vs. functional testing**

**Functional:**
- Specification
  - specified properties
  - Oracle
    - verdict
- Analysis
  - functional tests activate specified behaviour
  - Implementation
    - test results

**Structural:**
- Specification
  - specified properties
  - Oracle
    - verdict
- Analysis
  - structural tests activate implemented behaviour
  - Implementation
    - test results
Unit structural testing is useful

Functional test cases may not cover all the code

• The engineer may overlook certain functionalities

• Certain parts of code can depend on implementation choices and cannot be properly covered by the specification

Evaluation of structural coverage

Adding test cases to complete structural coverage
Unit structural testing can be mandatory

Development, evaluation and certification standards

- Common Criteria for IT Security Evaluation
- DO-178B (avionics)
- ECCS-E-ST-40C (space)
- IEC/EN 61508 (Electronic Safety-related Systems) & derived standards:
  - ISO 26262 (automotive)
  - IEC/EN 50128 (rail)
  - IEC/EN 60601 (medical)
  - EC/EN 61513 (nuclear)
  - IEC/EN 60880 (nuclear safety-critical)
  - IEC/EN 61511 (process e.g. petrochemical, pharmaceutical)
CFG and code coverage by example

C code
1 int f(int x){
2    if(x < 0)
3        x = x + 1;
4    if(x != 1)
5        x = 2*x;
6    return x; }

control-flow graph (CFG)

statement coverage

branch coverage

infeasible path

all-path coverage
Path predicate (path condition) by example

C code

```c
int f(int x){
    if (x < 0)
        x = x + 1;
    if (x != 1)
        x = 2*x;
    return x; }
```

control-flow graph (CFG)

Path predicate

\[ x \leq 0 \land (x + 1) \neq 1 \]

infeasible path

unsatisfiable path predicate
Automated structural testing... Why?

Achieving desired test coverage manually is costly

Must be done again after any code modification

Infeasibility of a test objective can be difficult to show manually

Automated structural testing tools can be used
  • to reach the uncovered objectives,
  • to determine that some of them are unreachable,
  • with a low cost overhead
Outline

1. Structural testing: a brief introduction
2. PathCrawler tool
3. Test parameters
4. Oracle and program debugging
5. Strengths and limits of structural testing
6. Structural test for other properties/purposes
7. Bypassing the limits
PathCrawler tool

- Concolic /DSE testing tool for C developed at CEA LIST
- Input: a complete compilable source code
- Automatically creates test cases to cover program paths
- Uses code instrumentation, concrete and symbolic execution, constraint solving
- Exact semantics: don’t rely on concrete values to approximate the path predicate
- Similar to PEX, DART/CUTE, KLEE, SAGE etc.
PathCrawler explores the tree of feasible paths

depth-first search with non-deterministic choice of suffix

test1: x = -5

\[
\begin{align*}
x_0 & < 0 \\
x_1 &= x_0 + 1 \\
x_1 &\neq 1 \\
x_2 &= 2x_1
\end{align*}
\]

```c
1 int f(int x) {
2    if (x < 0) {
3        x = x + 1;  
4    } else if (x != 1) {
5        x = 2*x;  
6    }  
7    return x; }
```
PathCrawler explores the tree of feasible paths

depth-first search with non-deterministic choice of suffix

test1: \( x = -5 \)

\[
\begin{align*}
\text{x}_0 < 0 \quad &\xrightarrow{+2} \quad \text{x} \neq 1 \quad &\xrightarrow{+4} \\
\text{x}_1 = \text{x}_0 + 1 \quad &\xrightarrow{} \quad \text{x}_2 = 2\text{x}_1
\end{align*}
\]

\( x_0 < 0 \land (x_0 + 1) \neq 1 \)

```
1 int f(int x){
2     if(x < 0)
3         x = x + 1;
4     if(x != 1)
5         x = 2*x;
6     return x; }
```
PathCrawler explores the tree of feasible paths

depth-first search with non-deterministic choice of suffix

```
test1:  x = -5  x_0 < 0  \rightarrow x_1 \neq 1  \rightarrow x_0 < 0 \land (x_0 + 1) \neq 1
```

```
1 int f(int x){
2    if(x < 0)
3        x = x + 1;
4    if(x != 1)
5        x = 2*x;
6    return x; }
```
PathCrawler explores the tree of feasible paths

depth-first search with non-deterministic choice of suffix

test1: \( x = -5 \)

\[
\begin{align*}
x_0 &< 0 \\
x_1 &= x_0 + 1 \quad \text{+2} \\
x_1 &\neq 1 \\
x_2 &= 2x_1 \quad \text{+4}
\end{align*}
\]

\( x_0 < 0 \land (x_0 + 1) \neq 1 \)

\( x_0 < 0 \land (x_0 + 1) = 1 \quad \text{infeas.} \)

\( x_0 \geq 0 \)

\begin{verbatim}
1 int f(int x){
2   if(x < 0)
3     x = x + 1;
4   if(x != 1)
5     x = 2*x;
6   return x; }
\end{verbatim}
PathCrawler explores the tree of feasible paths

depth-first search with non-deterministic choice of suffix

test1: \( x = -5 \)

\[
\begin{align*}
    x_0 &< 0 \\
    x_1 &= x_0 + 1 \\
    x_1 &\neq 1 \\

4     if(x != 1)
5         x = 2*x;
6     return x; }

16
PathCrawler explores the tree of feasible paths

depth-first search with non-deterministic choice of suffix

test1:  $x = -5$

\[
\begin{align*}
x_0 &< 0 \\
x_1 & = x_0 + 1 \quad +2 \\
x_1 & \neq 1 \quad +4 \\
x_2 & = 2x_1 \\
\end{align*}
\]

\[x_0 < 0 \land (x_0 + 1) \neq 1\]

\[x_0 < 0 \land (x_0 + 1) = 1 \quad \text{infeas.}\]

test2:  $x = 25$

\[
\begin{align*}
x_0 &\neq 1 \\
x_1 & = 2x_0 \quad -4 \\
x_2 & = 2x_1 \\
\end{align*}
\]

\[x_0 \geq 0 \land x_0 \neq 1\]

\[x_0 \geq 0 \land x_0 = 1\]
PathCrawler explores the tree of feasible paths

*depth-first search with non-deterministic choice of suffix*

**test1:** $x = -5$

$x_0 < 0 \quad x_0 < 0 \land (x_0 + 1) \neq 1$

$x_1 = x_0 + 1 \Rightarrow x_1 \neq 1 \Rightarrow x_2 = 2x_1$

$x_1 = x_0 + 1 \Rightarrow x_0 = 1$

$x_2 = 2x_1 \Rightarrow x_0 \neq 1 \Rightarrow x_0 = 1$

**test2:** $x = 25$

$x_0 < 0 \quad x_0 < 0 \land (x_0 + 1) = 1 \quad$ infeas.

$x_0 < 0 \Rightarrow x_0 + 1 = 1 \Rightarrow x_2 = 2x_1$

$x_0 \neq 1 \Rightarrow x_0 = 1$

$x_1 = 2x_0 \Rightarrow x_0 \neq 1$

**test3:** $x = 1$

$x_0 \geq 0 \land x_0 \neq 1$

$x_0 \geq 0 \Rightarrow x_0 = 1$

$x_1 = 2x_0 \Rightarrow x_0 \neq 1$

$x_0 \geq 0 \Rightarrow x_0 = 1$
Freely available test-case generation web service

- Instead of open-source or demonstration version
- No porting, no installation, universal user interface
- Well adapted to
  - Teaching
  - Use by project partners
  - Evaluation, understanding of Precondition and Oracle
- Limited version (contact us for unlimited access)

During the tutorial

- Browser: no cache recommended
- Do not start several test generation sessions in parallel
Example 1. Robust implementation of Tritype

Simple program Tritype

- inputs: three floating-point numbers \( i, j, k \)
- returns the type of the triangle with sides \( i, j, k \):
  3 (not a triangle), 2 (equilateral), 1 (isosceles), 0 (other)

Robust: validity of inputs is tested ("not a triangle")

\[\Rightarrow\] Any test case can be interesting and useful

"Test with predefined params" on pathcrawler-online.com

Observe the number of test cases. Check the results.
PathCrawler outputs

• A suite of test cases including
  ✷ Input values (check these for Example 1)
  ✷ Concrete outputs (check these for Example 1)
  ✷ Symbolic outputs (better illustrated by Example 5)
  ✷ Path predicate (better illustrated by Example 5)
  ✷ Test driver
  ✷ Oracle verdict (better illustrated by Example 10)

• Explored program paths with
  ✷ their status (covered, infeasible, assume violated …)
  ✷ path predicate (only for covered paths in online version)
Outline

1. Structural testing: a brief introduction
2. PathCrawler tool
3. Test parameters
4. Oracle and program debugging
5. Strengths and limits of structural testing
6. Structural test for other properties/purposes
7. Bypassing the limits
Example 2. Non robust implementation of Tritype

No validity check lines 10-13, no “not a triangle” answer
⇒ Are the test cases still interesting?

“Test with predefined params” on pathcrawler-online.com
Observe the number of test cases. Check the results.

Where is the problem?
Do we really want such input values in this case?
Exercise 3. Customize test parameters for Tritype

How to generate appropriate test cases only?
⇒ define a precondition!

Exercise. Start from Example 2. “Customize test parameters”

- Restrict the domains of inputs $i$, $j$, $k$ to non-negative values:
  \[ 0 \leq \frac{1.7976931348623157e+308}{\text{non negative values}} \]

- Add 3 unquantified preconditions:
  \[
  i + j > k \\
  j + k > i \\
  i + k > j
  \]

- Confirm parameters and check the results.
Example 4. C Precondition for Tritype

Another way to define a precondition
⇒ in a C function

Tritype_precond returns 1 iff the precondition is verified

“Customize test parameters” on pathcrawler-online.com to check that Pathcrawler has activated the C precondition.

Confirm & observe the number of test cases & results.
Test parameters

- Define admissible inputs (precondition)
  - Domains of input variables
  - Relations between variables…

- Wrong test parameters may
  - Indicate inexistent bugs (the bug is in the input)
  - Provoke runtime errors
Example 5. Merge with default parameters

Merge of two sorted arrays \( t_1, t_2 \) into a sorted array \( t_3 \)

- parameters: arrays \( t_1[3], t_2[3], t_3[6] \) of fixed size

“Test with predefined params” on pathcrawler-online.com

Check the concrete outputs.

What is wrong with the concrete outputs?

This example also illustrates well the information on array sizes, symbolic outputs and path predicate included in a test-case
Exercise 6. Quantified precondition for Merge

If the input arrays $t_1$ and $t_2$ are not ordered, Merge does not work!

Exercise. Start from Example 5. “Customize test parameters”
- Add two quantified preconditions ($INDEX$ is a reserved word):
  for all $INDEX$
    such that $INDEX < 2$
      we have $t_1[ INDEX ] \leq t_1[ INDEX + 1 ]$
  for all $INDEX$
    such that $INDEX < 2$
      we have $t_2[ INDEX ] \leq t_2[ INDEX + 1 ]$
- Confirm parameters and check the results.

Are the input arrays $t_1$ and $t_2$ sorted now? Is $t_3$ sorted on output?
Example 7. Merge with pointer inputs

Merge of two sorted arrays $t_1$, $t_2$ into a sorted array $t_3$

• params: arrays $t_1[\ ]$, $t_2[\ ]$, $t_3[\ ]$ of variable size, $l_1$ the size of $t_1$, $l_2$ the size of $t_2$
• precondition $t_1$, $t_2$ ordered arrays predefined
• reduced domains of elements $[-100, 100]$ predefined

“Customize test parameters” on pathcrawler-online.com to see preconditions then Confirm & check the results.

Why are there errors?
Exercise 8. Input arrays (pointers) size

$t_1$, $t_2$, $t_3$ should contain resp. $l_1$, $l_2$, $l_1+l_2$ allocated elements. Wrong input array size => Runtime errors while executing tests!

Exercise. Start from Example 7. “Customize test parameters”
- Specify domains for dim($t_1$), dim($t_2$), dim($t_3$)
  
  
  0 <= dim($t_3$) <= 6
  0 <= dim($t_2$) <= 3
  0 <= dim($t_1$) <= 3

- Add three unquantified preconditions:
  
  dim($t_1$) == $l_1$
  dim($t_2$) == $l_2$
  dim($t_3$) == $l_1 + l_2$

- Confirm parameters and check the results.

How many test cases are generated?
Partial test coverage: k-path criterion

- In presence of loops, all-path criterion may generate too many test cases
- The user may want to limit their number
- k-path coverage restricts the all-path criterion to paths with at most k consecutive iterations of each loop (k=0,1,2...)
Exercise 9. Merge with partial test coverage: k-path

To reduce the number of test cases, modify test criterion.

Exercise. Continue Exercise 8 with the same test parameters you defined. “Customize test parameters”
- Set “Path selection strategy” to 2 (for k-path with k=2)
- Confirm parameters and check the results.

How many test cases are generated now?
Do the test case outputs seem correct?
Outline

1. Structural testing: a brief introduction
2. PathCrawler tool
3. Test parameters
4. **Oracle and program debugging**
5. Strengths and limits of structural testing
6. Structural test for other properties/purposes
7. Bypassing the limits
Role of an oracle:
• examines the inputs and outputs of each test
• decides whether the implementation has given the expected results
• provides a verdict (success, failure)

An oracle can be provided by
• another, or previous implementation
• checking the results without implementing the algorithm
Example 10a. Oracle and debugging

Re-read the intended functionality of Merge, as explained in the comment.

“Customize test parameters” to see an example of an oracle

Is this oracle complete?
Example 10b. Oracle and debugging

“Customize test parameters” to see another example of an oracle

Is this oracle complete?
Example 10c. Oracle and debugging

“Customize test parameters” to see an example of a complete oracle

Exercise. Confirm parameters and check the results. Use the results to find the error in the implementation.

Hint: The paths of failed test cases have a common part...
Outline

1. Structural testing: a brief introduction
2. PathCrawler tool
3. Test parameters
4. Oracle and program debugging
5. Structural test for other properties/purposes
6. Strengths and limits of structural testing
7. Bypassing the limits
Structural test for other properties or purposes

PathCrawler explores the implementation and can also be used to check:

- for **runtime errors** during program execution (seen in Ex.7)
- for **anomalies** detected during analysis of the covered paths:
  - uninitialised variables
  - buffer overflow
  - integer overflow
  - ...
- whether the implementation performs **unnecessary computation**
- the effective **execution time** of each path (at least for one set of inputs), by running the generated tests on a platform which can measure execution time
- for unreachable or “dead” code: check infeasible partial paths.

If all paths leading to the code are infeasible then the code is unreachable (for the given precondition): is this intentional?
Runtime error or anomaly: search space is pruned

- Error during test execution or anomaly detected by analysis
- Incomplete coverage
Example Uninit. Uninitialised variable

In this example, the local variables are not always initialised before their value is read. This is a typical “anomaly”: probably a bug but does not cause a run-time error.

“Test with predefined parameters” and check the results.

Are there any errors or warnings? Why?
Are all feasible paths covered?
Bsearch is an implementation of dichotomic search for value $x$ in sorted array $A$.

“Customize test parameters” to see the predefined oracle and parameters. Confirm them and check the results.

Is this a correct implementation?
Examine the predicates of the cases where $x$ is present.
Is this an efficient implementation?
1. Structural testing: a brief introduction
2. PathCrawler tool
3. Test parameters
4. Oracle and program debugging
5. Structural test for other properties/purposes
6. Strengths and limits of structural testing
7. Bypassing the limits
Dichotomic search: structural vs. other strategies

Example: dichotomic search for a value int \( x \) in a sorted array int \( A[10] \).

Random testing: Unlikely to construct cases in which \( x \) equals one of the elements of \( A \) and to detect false negatives (\( x \) not detected when present)

Functional testing: Constructs
- many cases in which \( x \) is present (probably from 1 to 10?) and
- fewer cases in which \( x \) is absent (1 or 2 ?)

Structural testing: Constructs a case
- for each position in \( A \) for which \( x \) can be detected and
- for each relation to elements of \( A \) for which absence of \( x \) is detected.

Structural test constructs more presence cases than random, more absence cases than functional, rarely constructs cases where \( x \) is present by chance.
Example Chance. Failures by chance?

Bsearch is another implementation of dichotomous search for value $x$ in sorted array $A$. It contains a bug which can result in false positives ($x$ present but not detected).

The parameters are the same as in the previous example. Confirm them and check the results.

Is the presence or absence of $x$ in $A$ always determined by the path predicate?

Hint: look at failing cases or those where $x$ is present.
Example 11. Limitations of structural testing

Bsearch is another erroneous implementation of dichotomic search for value $x$ in sorted array $A$.

The parameters are the same as in the previous example. Confirm them and check the results.

Are there any failures?
Limitations of structural testing

Path testing is

- **effective** when a bug is *always revealed* by a path,
- **less so** when *only some of the values* which activate the path cause the bug to be revealed

PathCrawler chooses arbitrary values to test each path

They may not be the values which will reveal a bug

We can make PathCrawler *go looking for bugs* by sub-dividing the paths
Outline

1. Structural testing: a brief introduction
2. PathCrawler tool
3. Test parameters
4. Oracle and program debugging
5. Structural test for other properties/purposes
6. Strengths and limits of structural testing
7. Bypassing the limits
Cross-checking conformity with a specification

implementation

```c
int f(int x){
    if(x < 0)
        x = x + 1;
    if(x != 1)
        x = 2*x;
    return x; }
```
Cross-checking conformity with a specification

**Implementation**

```c
int f(int x) {
    if(x < 0)
        x = x + 1;
    if(x != 1)
        x = 2*x;
    return x; }
```

**Specification**

If $x$ is less than 1 then the result should be $2(x + 1)$
Else the result should be $2x$
Cross-checking conformity with a specification

\[ \begin{align*}
&x_0 < 0 \quad \Rightarrow \quad x_1 \neq 1 \\
&\text{imp} = 2x_1 \\
\end{align*} \]

\[ \begin{align*}
&x_0 \neq 1 \\
&\text{imp} = 2x_0 \\
&\text{imp} = x_0
\end{align*} \]

implementation

```c
int f(int x) {
    if (x < 0)
        x = x + 1;
    if (x != 1)
        x = 2*x;
    return x;
}
```

specification

```c
int spec_f(int x) {
    if (x < 1)
        x = 2*(x + 1);
    else
        x = 2*x;
    return x;
}
```
Cross-checking conformity with a specification

Implementation

```c
int f(int x) {
    if (x < 0)
        x = x + 1;
    if (x != 1)
        x = 2*x;
    return x;
}
```

Specification

```c
int spec_f(int x) {
    if (x < 1)
        x = 2*(x + 1);
    else
        x = 2*x;
    return x;
}
```

Comparison

```c
int cross_f(int x) {
    int imp = f(x);
    int spec = spec_f(x);
    if (imp != spec)
        return 0;
    else
        return 1;
}
```
Cross-checking conformity with a specification

\[
\begin{align*}
\text{imp} &= 2x_0 \\
\text{spec} &= 2x_0 \\
\text{imp} &= 2x_1 \\
\text{spec} &= 2(x_0+1)
\end{align*}
\]
Cross-checking conformity with a specification

\[ x_0 < 0 \quad \rightarrow \quad x_1 \neq 1 \quad \rightarrow \quad \text{imp} = 2x_1 \]
\[ x_0 \neq 1 \quad \rightarrow \quad \text{imp} = 2x_0 \]
\[ \text{imp} = x_0 \]

\[ x_0 < 1 \quad \rightarrow \quad \text{spec} = 2(x_0 + 1) \]
\[ \text{imp} = \text{spec} \quad \rightarrow \quad \text{OK} \]
\[ \text{spec} = 2x_0 \]

\[ x_0 < 0 \land (x_0 + 1) \neq 1 \land x_0 < 1 \rightarrow x_0 < 0 \]

$$\text{spec} = 2x_0$$

$$\text{imp} = \text{spec} \quad - \quad \text{BUG}$$

$$x_0 < 0 \quad - \quad x_0 < 0 \quad / \quad 2(x_0 + 1) = 2(x_0 + 1)$$

$$x_0 < 0 \quad - \quad x_0 < 0 \quad / \quad 2(x_0 + 1) 
eq 2(x_0 + 1)$$
Cross-checking conformity with a specification

\[ x_0 < 0 \rightarrow x_1 \neq 1 \rightarrow \text{imp} = 2x_1 \]

\[ x_0 < 0 \rightarrow x_1 = x_0 + 1 \rightarrow \text{imp} = 2x_1 \]

\[ x_0 < 0 \rightarrow x_1 \neq 1 \rightarrow \text{imp} = 2x_1 \]

\[ x_0 < 0 \rightarrow \text{imp} = x_0 \]

\[ x_0 < 1 \rightarrow x_1 \neq 1 \rightarrow \text{imp} = 2x_1 \]

\[ x_0 < 1 \rightarrow \text{spec} = 2(x_0 + 1) \]

\[ x_0 < 1 \rightarrow \text{imp} = 2x_0 \]

\[ x_0 < 1 \rightarrow \text{spec} = 2x_0 \]

\[ \text{imp} = \text{spec} \rightarrow \text{OK} \]

\[ \text{imp} = \text{spec} \rightarrow \text{BUG} \]

\[ x_0 \geq 0 \land x_0 \neq 1 \land x_0 < 1 \rightarrow x_0 = 0 \]

\[ x_0 \geq 0 \land x_0 \neq 1 \land x_0 \geq 1 \rightarrow x_0 > 1 \]
Cross-checking conformity with a specification

\[ x_0 < 0 \]
\[ x_1 = x_0 + 1 \]
\[ x_1 \neq 1 \]
\[ \text{imp} = 2x_1 \]
\[ x_0 \neq 1 \]
\[ \text{imp} = 2x_0 \]
\[ \text{imp} = x_0 \]
\[ x_0 < 0 \]
\[ x_1 = x_0 + 1 \]
\[ x_0 < 1 \]
\[ \text{spec} = 2(x_0 + 1) \]
\[ \text{spec} = 2x_0 \]
\[ \text{imp} = \text{spec} \]
\[ \text{OK} \]
\[ \text{BUG} \]

\[ x_0 = 0 \land 2x_0 = 2(x_0 + 1) \]
\[ x_0 = 0 \land 2x_0 \neq 2(x_0 + 1) \]
\[ x_0 > 1 \land 2x_0 = 2x_0 \]
\[ x_0 > 1 \land 2x_0 \neq 2x_0 \]
Cross-checking conformity with a specification

\[
\begin{align*}
\text{if } x_0 < 0 & \quad \Rightarrow x_1 = x_0 + 1 \quad \Rightarrow x_1 \neq 1 \quad \Rightarrow \text{imp} = 2x_1 \\
\text{imp} = x_0 & \quad \Rightarrow x_0 \neq 1 \\
\text{imp} = 2x_0 & \quad \Rightarrow x_0 < 1 \\
\text{spec} = 2x_0 & \quad \Rightarrow \text{spec} = 2(x_0 + 1) \\
\text{imp} = \text{spec} & \quad \Rightarrow \text{OK} \\
\text{BUG} & \quad \Rightarrow x_0 < 0
\end{align*}
\]

\[
\begin{align*}
\text{if } x_0 = 0 & \quad \Rightarrow x_1 = x_0 + 1 \quad \Rightarrow x_1 \neq 1 \quad \Rightarrow \text{imp} = 2x_1 \\
\text{imp} = 2x_0 & \quad \Rightarrow x_0 < 1 \\
\text{spec} = 2x_0 & \quad \Rightarrow \text{spec} = 2(x_0 + 1) \\
\text{imp} = \text{spec} & \quad \Rightarrow \text{OK} \\
\text{BUG} & \quad \Rightarrow x_0 = 0
\end{align*}
\]

\[
\begin{align*}
\text{if } x_0 > 1 & \quad \Rightarrow x_1 = x_0 + 1 \quad \Rightarrow x_1 \neq 1 \\
\text{imp} = 2x_0 & \quad \Rightarrow x_0 < 1 \\
\text{spec} = 2x_0 & \quad \Rightarrow \text{spec} = 2(x_0 + 1) \\

\text{BUG} & \quad \Rightarrow x_0 > 1
\end{align*}
\]

\[
\begin{align*}
\text{if } x_0 = 1 & \quad \Rightarrow x_1 = x_0 + 1 \quad \Rightarrow x_1 \neq 1 \\
\text{imp} = 2x_0 & \quad \Rightarrow x_0 < 1 \\
\text{spec} = 2x_0 & \quad \Rightarrow \text{spec} = 2(x_0 + 1) \\
\text{imp} = \text{spec} & \quad \Rightarrow \text{OK} \\
\text{BUG} & \quad \Rightarrow x_0 = 1
\end{align*}
\]
Example 12. Testing conformity with a specification

Spec_Bsearch is a specification for Bsearch, similar to the oracle. Test function CompareBsearchSpec that

- stores inputs, calls Bsearch,
- calls Spec_Bsearch to provide a verdict.

All-path testing will try cover all combinations of paths in Bsearch and Spec_Bsearch.

“Customize test parameters” to see the predefined oracle and parameters. Confirm them and check the results.

Why are failures reported this time? Can you find the bug?
Assume/assert instead of precondition/oracle

Preconditions filter out cases with bad values of inputs
Oracles check outputs
We can also check values at any point in the source code:

\[ \text{pathcrawler}_\text{assume}(\text{cond}) \]

to filter out cases where cond is not satisfied

\[ \text{pathcrawler}_\text{assert}(\text{cond}) \]

to check if cond is always satisfied,
to force search for a counter-example by creating a new branch to explore
Searching for run-time errors or anomalies

One way to detect run-time errors and anomalies:

“add a branch” using pathcrawler_assert to the source code at each use of any partial operation (e.g. pointer de-referencing, division,...) and then do structural testing to cover these branches
Example 13. Searching for run-time errors (1)

Study Example 13.

“Test with predefined params” on pathcrawler-online.com
Check the results.

Is there any failure?
Study Example 14.

“Test with predefined params” on pathcrawler-online.com
Check the results.

Is there any failure?
The SANTE method: Static ANalysis and TEsting

*Searching for run-time errors may require a lot of tests!*

Better to restrict structural testing to unconfirmed threats revealed by static analysis…

SANTE uses the Frama-C platform to call

- static value analysis to prove some threats safe and generate alarms for potential errors,
- structural testing with PathCrawler for remaining alarms

[Chebaro et al., SAC 2012, www.frama-c.com]
Conclusion

Structural testing can be very useful to evaluate and complete test coverage. It also has many other uses.

Test generation is automatic but the user must define the test parameters.

This tutorial showed:
- how to define a precondition, an oracle, an assertion
- test coverage criteria
- how to test conformity with a specification
- combined uses with static analysis
Extra exercises

- Ex. 15. Read the intended functionality of ArrayCmp as explained in the comment. Test with the default parameters. Are there errors? Complete the test parameters (without adding an oracle). Test again and explain the results.

- Ex. 16. Test with the predefined parameters to find the bug.

- Ex. 17. Study the intended functionality of Bsort as explained in the comment. Complete the test parameters for array dimensions 0-5 and test with the predefined oracle. Use the results to find the bug.

- Ex. 18. Copy the source code of Example UC and add 2 calls to pathcrawler_assume (one for each sub-condition of line 22) in order to obtain just the tests which activate line 23. Compress the file and upload it (“Test your code”). Add the quantified precondition to the test parameters and check the tests which are effectively generated.
